it works flawlessly. I have also tried to change the port to other ones including 80, 8080, and 8888 but to no avail. How can I make this work? A: I've just solved my issue. It was a stupid mistake that I didn't see the cause right away. I was trying to use my browser proxy settings. But I just needed to make sure that my browser proxy setting is disabled in my Windows. So by default my proxy settings is set to no proxy. Hope this can help anybody else facing this issue. In recent years, an automobile telephone system has been developed. In such a telephone system, an exchange and a trunk circuit which are connected to one another through a communication channel are required to have functions for data transmission and reception. In order to satisfy such requirements, some measures have been taken. One of such measures is to use an automobile telephone device having a built-in data transmission and reception circuit. A transmission antenna is connected to a speaker of the telephone device, and a reception antenna is connected to a microphone of the telephone device. The transmission and reception antennas are required to be positioned in an outside of the automobile and away from an internal portion of the automobile in order to prevent an obstruction by raindrops or dust entering the automobile through the transmission and reception antennas. As a result, it is desirable to construct the antennas inside of the automobile so as to keep the antenna inside the automobile. On the other hand, if the antennas are constructed inside of the automobile, the inter-space between the antennas and the internal portion of the automobile becomes narrow. Thus, the antennas can not be connected to the speaker and the microphone connected to the inside of the automobile. In order to satisfy such requirements, a face plate having a substantially rectangular plate-shape has been proposed as a housing member having a hole into which the transmission and reception antennas can be inserted. However, in such a face plate, the hole can not be opened from the front surface of the face plate to the upper surface of the face plate. For this reason, when the transmission and reception antennas are inserted into the hole, there is a case that one of the transmission and reception antennas is positioned at the lower portion of the hole and the other is positioned at the upper portion of the hole. In such a case, the transmission and reception antennas can not be inserted in parallel. In order to solve such a problem, it is required to provide a special 82157476af
